Extractor Case

Myande Extractor *Erechim, RS, Brasil*

We thank our Brazilian customer for trusting in Myande's technology, quality and reliability applied to the "MODEL E" extractor that is in process of delivery for mounting in the south of Brazil. The equipment will be added to their line of existing American technology in the area of solvent extraction.

Similarly, the company will add two Myande 500 ton/day flakers in the Preparation area where they currently have equipments of Argentine origin.

Both changes will allow the company to increase their soybean processing capacity and strengthen their position in the demanding Brazilian market.

The extractor supplied is totally built in **stainless steel**, including its internal parts, and ensures the integrity and durability of the equipment.

- Floor sections with continuous drainage.
- Side walls.
- Roof and miscella collecting hoppers.

The provision is completed with **auxiliary feeding elements and internal pressure control** by using the associated corresponding condenser to allow automation of operations in accordance with Myande's world-class international standards.

Likewise, we need to highlight that the two flakers that are part of the set already have the latest concepts of operational and process safety for satisfying the strict NBR standards (Brazilian Safety Standards) which allow permanent monitoring of critical variables in the continuous process.
